### Physics Of The Aurora And

Aurora. When energetic charged particles enter the earth's atmosphere from the solar wind, they tend to be channeled toward the poles by the magnetic force which causes them to spiral around the magnetic field lines of the earth. They are energetic enough to ionize air molecules, so a considerable number of atoms and molecules are elevated to excited states.

The Aurora Borealis, otherwise known as the Northern Lights, is a physics phenomenon that can be magical to observe, striking onlookers to wonder about the cause of the whimsical lights that dance overhead. This extraordinary display is caused by charged particles being expelled into space from the sun. When those particles come into contact with the magnetic field of Earth, the Earth directs the charge to the poles where they collide with gas molecules and create the amazing displays that ...

Aurora, luminous phenomenon of Earth 's upper atmosphere that occurs primarily in high latitudes of both hemispheres; auroras in the Northern Hemisphere are called aurora borealis, aurora polaris, or northern lights, and in the Southern Hemisphere aurora australis, or southern lights. aurora australis A display of aurora australis, or southern lights, manifesting itself as a glowing loop, in an image of part of Earth's Southern Hemisphere taken from space by astronauts aboard the U.S ...

About this book Published by the American Geophysical Union as part of the Special Publications Series. Physics of the aurora and airglow is a diversified subject, and this characteristic is, I think, the secret of its charm. But it is growing up in an age when physicists must necessarily specialize in narrow fields of interest.

This interactive learning module introduces the systems and processes through which the Earth's magnetic field and upper atmosphere are influenced by the sun, eventually leading to the magnificent auroral displays. Developed especially for university professors and students in the fields of physics and astronomy, this module includes sections on the history, lore, and science of the aurora, the magnetosphere, the thermosphere-ionosphere, basic electromagnetism, and upper-atmospheric physics.

### MetEd » Resource Description: Physics of the Aurora: Earth ...

Physics of Aurora. High speed energetic particles collide with atoms in Earth's atmosphere at a height of anywhere from about 50 to a few hundred miles above Earth's surface to cause the aurora. These high speed particles, which are usually electrons, originate from space, specifically from the solar wind, blowing outward from the Sun. When the electrons from space strike an atom or molecule in Earth's atmosphere, they give one of the electrons in the atom an energy boost.

### Aurora: Physics of Aurora

Physics of Aurora Borealis. November 16, 2015. We must all have seen a large collection of beautiful photographs on the internet with hanging green and pink lights over a clear night sky. This phenomenon is called the "aurora borealis" when it occurs in the northernmost latitudes and "aurora australis" when it occurs in the southernmost latitudes. This phenomenon occurs at the poles and the concepts involved are strongly correlated to what we learn during the A Level physics tuition ...

### Physics of Aurora Borealis - Physics Tuiton

The aurora began as a line of 'auroral beads' along an arc which grew exponentially in brightness and size. These growing ripples are a hallmark of an instability in space. By comparing these...

### Auroras unlock the physics of energetic processes in space

The colors of the aurora vary, depending on altitude and the kind of atoms involved. If ions strike oxygen atoms high in the atmosphere, the interaction produces a red glow. This is an unusual aurora—the most familiar display, a green-yellow hue, occurs as ions strike oxygen at lower altitudes.

### Did the aurora borealis play a role in sinking the Titanic?

Auroras are the result of disturbances in the magnetosphere caused by solar wind. These disturbances are sometimes strong enough to alter the trajectories of charged particles in both solar wind and magnetospheric plasma. These particles, mainly electrons and protons, precipitate into the upper atmosphere (thermosphere / exosphere).
